

# PHYTODIVERSITY, COMMUNITY ASSESSMENT AND PHYSIOCHEMICAL STUDIES OF CONIFEROUS FOREST OF KALASH VALLEY CHITRAL, PAKISTAN

**Aziz Ur Rahman\*, Asad Ullah\*, Syed Ghias Ali\*, Syed Mukaram Shah\***

\*Centre of Plant Biodiversity, University of Peshawar, Khyber Pakhtunkhwa, Pakistan

**Abstract-**The current investigation reveals the presence of 70 plant species spreading over 30 families within the Conifer Forest of Kalash Valley. Noteworthy among these are nine gymnosperm species, with four namely *Cedrus deodara*, *Juniperus excelsa*, *Juniperus communis*, *Pinus gerardiana* and *Pinus wallichiana*, prominently shaping various communities. The study identifies 11 distinct communities distributed across diverse localities. The *Cedrus deodara* and *Pinus gerardiana* Community emerges as dominant with open canopy. Moreover, they also support maximum floral diversity. Soil and soil component study discerns that the soil in the Bumburet Kalash area proves more conducive to forest ecosystems average pH, moderate electrical conductivity, lower salinity and facilitating enhanced water movement and nutrient transport and in contrasts with Rambur, which appears to exhibit comparatively poorer fertility in comparison to the other two regions and Rambur was in between.

**Index terms**-Conifer, communities, floral diversity, Kalash Valley, soil components

## INTRODUCTION

A landlocked mountainous region of Hindu Kush Range named Chitral, situated between  $35^{\circ}15'$  to  $36^{\circ}55'$  North latitudes and  $71^{\circ}01'$  to  $73^{\circ}05'$  East longitudes. It is extended to an area of 14,850 km<sup>2</sup> (DCR, 1998; Ali and Qaiser, 2009). Chitral is divided to two separate district in 2018; Upper Chitral and lower Chitral. The Study area, Kalash valley, falls in south east of Lower Chitral. It is positioned 40 km downstream from Chitral city from  $35^{\circ} 70'$  to  $35^{\circ}42'$  North latitudes and  $71^{\circ}69'$  to  $71^{\circ}41'$  East longitudes. The elevation ranges from 1900 to 2200 meters (GoP, 1998; Open Location Code 8J7 HPM6H). The valley comprises of three sub-valleys, Bumburet, Rambur and Birir. These valleys host diverse flora including oak and coniferous forests. These forests also known as Taiga or Boreal forests are rich in biodiversity due to its sharp topographic changes from lower to higher elevation (Hadi and Ibrar, 2015; Ullah et al., 2014; Zeb, 2019). Kalash valley, despite its arid nature, exhibits significant floristic diversity, mainly because it is considered convergence point for of the Irano-Turanian (winter rain), Sino-Himalayan (summer rain), and Central Asiatic (permanently arid) regions (Birgees et al., 2022). The flora of the area reflects transitional and ecotone status due altitudinal gradients, climatic variation and the geographical position making the distribution patterns of various taxa (Nusser and Dickore, 2002). According to Ahmed and Latif (2007), the inhabitants of the area rely on forests and forest products for their livelihood entirely according to a report approximately 25 thousand metric tons of forest wood is used as a source of fuel by 13% of the population Irum et al., 2014).

Bumburet, the largest valley among the Kalash valleys, is situated at coordinates  $35^{\circ}41'$  N and  $71^{\circ}38'$  E, characterized by rugged topography and steep slopes. Rambur, positioned at a higher elevation than Bumburet, with more feeding glaciers and alpine meadows, approximately 8 kilometres north of Bumburet, between coordinates  $35^{\circ}46'$  N and  $71^{\circ}40'$  E while Birir Valley is situated at the southernmost end of Chitral city. It has a narrower width at coordinates  $35^{\circ}40'$  N and  $71^{\circ}45'$  E, with an elevation of 1360 meters (Zeb, 2019).

Floristic surveys serve as a systematic inventory for studying and utilizing plant and plant related wealth. It provides valuable insights for proper identification of plants, its communities and niche (Gordon and Newton, 200). These studies are crucial in presenting local plants and plant communities with details on their distribution, distinct characteristics (Gotzenberger et al., 2012). Along with floristic survey Phytosociological approach is crucial for better understanding of plant and health of plant communities. It focuses on understanding plant communities, structural relationships, and compositional distribution of flora of a region. It also aids in the planning, management and exploitation of natural resources (Pot, 2011). It also provides insights into plant distribution under different ecological influence of biotic and abiotic factors (Morris, 2020). As forests face ongoing dramatic changes due to pollution, human population pressure, deforestation, habitat destruction and invasive species. So regular updates on floral diversity and plant

communities are essential for understanding species interactions and their relationships with the environment (Shaheen et al., 2014; Stter, 2017).

The research focuses on coniferous forest of Kalash valley as Conifers are distinguished by the dominance over other plant species due to their enduring capabilities to extremely cold seasons. Conifers including *Cedrus deodara*, *Juniperus exelsa*, *Juniperus communis*, *Pinus gerardiana* and *Pinus wallichiana*.

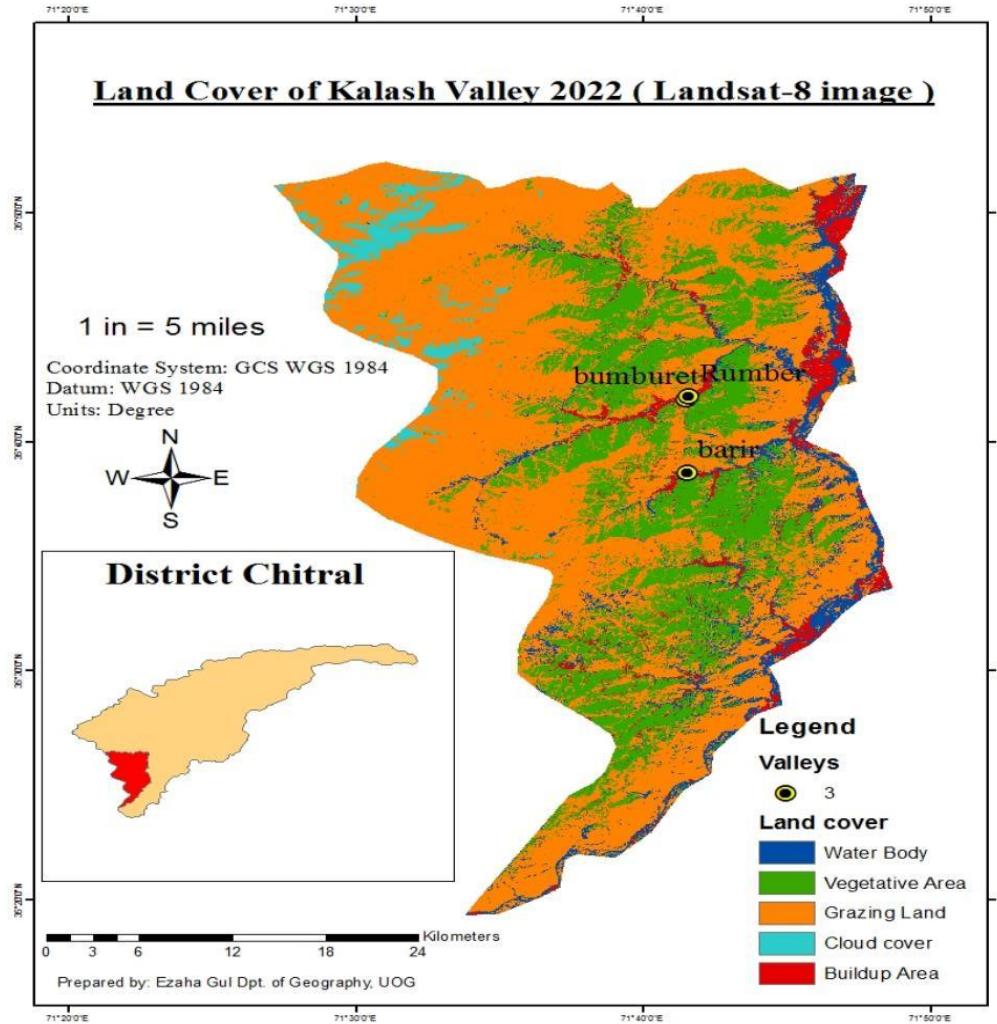

Fig.1. Map of the area showing LULC taken using NDVI Land Sat-8 on August, 2022).

## MATERIALS AND METHODS

### Field work

#### A. Sampling

Field work for this study were carried out between 2021 and 2023 in various parts and attitudinal zones of Bumburet, Birir and Rambur region of Chitral specifically above 1800 masl as Conifers dominate in Higher altitude. The study was to find communities of Four Conifer trees i.e., *Cedrus deodara*, *Juniperus exelsa*, *Juniperus communis* *Pinus gerardiana* and *Pinus wallichiana* and communities coexist with these gymnosperms. *Picea smithiana* and *P. roxburghii* were occasionally reported so contribution was not mentionable. Ephedra species were found in lower story of communities. The specimens were identified with help of literature (Ali et al., 2016; Stewart, 1972; Nasir and Ali, 1970-1989; Ali and Nasir, 1989-1991; Ali and Qaiser, 1993-2022; Khan, 2010). The collected plant specimens were deposited at Herbarium Centre of Plant Biodiversity, University of Peshawar. Soil from each sampling site was collected with the help of soil bucked agar. The soil was weighed and packed in plastic bags for further laboratory analysis.

## B. Taxonomic key

In the process of crafting taxonomic keys for trees, a hectic survey and measurement of various tree components was conducted. Bark, twigs, fresh leaves, cones, seeds and fruits underwent thorough observation. Precise measurements of these parts were taken using both a scale and vernier calliper. Twigs and leaves were carefully collected for mounting and preservation. The locations for observations and measurements were diligently recorded with the aid of GPS for accuracy and reference in the taxonomic key preparation.

## C. Field statistics

Nine gymnosperm species were identified in the region, with seven exhibiting a canopy in the upper story, while two were herbaceous, presenting a more or less erect stature. A total of 50 plots, each measuring 0.1 hectares, were randomly established to assess vegetation indices. Additionally, similar in number more or less one hectare was employed to characterize plant communities (Feely et al., 2020; Jiajia, 2023). Stands of forest minimally disturbed vegetation by grazing or other activities were selected to represent the communities. They had either homogeneity or somewhere heterogeneous. Elevation was estimated by Altimeter and penned down and slope measurements were obtained by Clinometer. GPS was employed for estimating geographical coordinates. Local guides and informers were accompanied during the field work. A species list of upper and under storey was compiled using counting and identifying all shrubs and herbs. Tree seedlings (<10 cm dbh) were counted in lower storey.

## Quantitative analysis

Quantitative information for gymnosperms particularly conifers including Angiosperms was summarized following method of Bonham (2005). Percentage distribution, average DBH and average height were also measured.

## Soil analysis

For collection of soil samples stratified random sampling methodology was used. Soil samples with in each block of representing communities were collected using Soil bucked agar from  $1 \times 1$  m<sup>2</sup> sub-plots within a quadrat. Soil from depths of 0-20 cm, 20-40 cm, and 40-60 cm were collected. In each Community, eight 5 to 10 samples were collected. Soil Auger was used for obtaining a core volume of 198.24 cm<sup>3</sup> and a height of 7.25 cm. Collected soil samples were labelled, underwent weighing and packing before being transported to the laboratory for further studies. Then they were dried in drying oven for 48 hour at 72°C for further analysis, including the determination of soil bulk density from air-dried samples. Moreover pH, Electrical Conductivity (EC), Electrical Conductivity in deci Siemens per meter (EC dS/m), Total Suspended Solids (TSS), Calcium Carbonate (CaCO<sub>3</sub>), Organic Matter (OM), Nitrogen, Phosphorus and Potassium level were measured. The soil samples were shifted to Agriculture Research Institute Tarnab Farm Peshawar for analysis. The standard procedure was adopted for this study (Bonham, 2005; Khan, 2010).

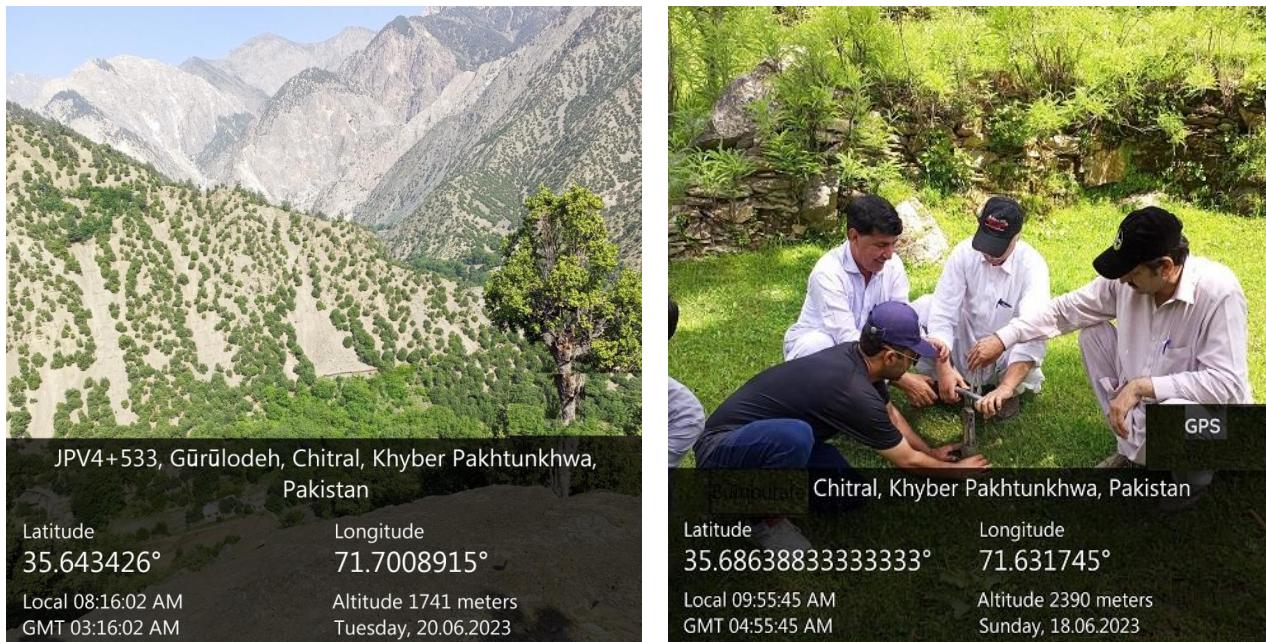

Fig.2. Community studies and soil sampling at the study area.

## RESULTS AND DISCUSSION

The Present study reveals 70 plant species belong to 30 families were common in Conifer forest of Kalash Valley. Among these 9 species were gymnosperms, out of which 4 species dominated to shape different types of communities were *Cedrus deodara*, *Juniperus excelsa*, *Juniperus communis* *Pinus gerardiana* and *Pinus wallichiana*. There were 11 communities found positioned in different localities. These communities were *Cedrus deodara* Community (Monospecific) *C. deodara* , *Cedrus deodara* and *Pinus gerardiana* community,*Cedrus deodara* & *Pinus wallichiana* Community(*C. deodara* Dominant), *CCedrus deodara* and *Quercus* community (*C. deodara* Dominant), *Pinus gerardiana* Community (Mono-specific), *Pinus gerardiana* and *Quercus* community (*P. gerardiana* Dominant), *Juniperus excelsa* & *Juniperus communis* community (Either is Dominant), *Juniperus excelsa* and *Betula* community(*J. excelsa* Dominant), *Pinus wallichiana* Community (Mono-specific/ Dominant), *Pinus wallichiana* and *Juniperus excelsa* Community (Either is dominant), *Quercus* spp. and *P. gerardiana* Community (*Quercus* Dominant) . Regarding distribution of Conifers *Juniperus* spp. comprises 21.88% of the population, *Cedrus deodara*, 28.62%, *Pinus gerardiana* constitutes 36.73%, followed by *Pinus wallichiana* at 12.73% and *Pinus roxburghii* at less than 1%. 61 species were common in lower strata.

*Cedrus deodara* Community was monospecific regarding Upper story with open canopy with 18 species in lower story as herbaceous plants. *Cedrus deodara* and *Pinus gerardiana* community was common in the region where either one was dominant. It also supports 28 other plant species. In *Cedrus deodara* and *Pinus wallichiana* Community where *C. deodara* was dominant also supported 23 species in lower strata. *Pinus wallichiana* and *Juniperus excelsa* community was found to support least flora of 16 species.

The physico-chemical analysis of soil in the Bumburet Kalash region reveals average pH of 7.27, electrical conductivity (EC) at 0.16 dsm<sup>-1</sup> I, organic matter (OM) content of 2.31% , calcium carbonate (CaCO<sub>3</sub>) content of 4.72% , nitrogen (N) content of 0.19%, phosphorus (P) at 5.99 mg kg<sup>-1</sup>, and potassium (K) at 105.05 mg kg<sup>-1</sup>. While in Birir Valley pH of 7.8, (EC) at 0.21 dsm<sup>-1</sup>, OM of 2.10%, CaCO<sub>3</sub> of 5.70% ,N 0.35 mg kg<sup>-1</sup>, P at 6.61 mg kg<sup>-1</sup> and K at 89.3 mg kg<sup>-1</sup>, OM 1.15 mg kg<sup>-1</sup>. Soil of Rambur reveals that pH of 7.55, EC 0.22 dsm<sup>-1</sup>, OM of 1.98%, CaCO<sub>3</sub> at 1.31% ,N content of 0.12%, P at 5 mg kg<sup>-1</sup>, K at 77.92 mg kg<sup>-1</sup>, C content of 1.12 mg kg<sup>-1</sup>. Among the three regions analysed, the soil in the Bumburet Kalash area appears to be better suited for forest ecosystems. With an average pH of 7.27, and moderate electrical conductivity (EC) of 0.16 dsm<sup>-1</sup> indicates lower salinity, supporting improved water movement and nutrient transport. The organic matter content of 2.31% is relatively higher. While Rambur appears to have relatively poorer fertility compared to the other two regions.

Table 1. Table of taxonomic description, distribution and economic utility of Gymnosperms of Kalash Valley

Plant species	Taxonomic description	Specimen examined	Distribution In Pakistan	Economic utility
<i>Juniperus communis</i> L.	H-4-8m , Medium-sized monoecious trees, stem spreading, rarely upright stems, bark reddish-brown, leaves in whorls of 3, measuring 0.5-1.7 x 0.1-0.3 cm. Male cones 0.2-0.7 x 0.2-0.35 cm), 6-8 pairs microsporophylls, Female cones 0.3-0.8 x 0.3-0.6 cm), 3 to 4 pairs.	Bu-35.42/71.38E (3103 m ) Ru-35.40 N/71.36 E(2939m) Bi-35.36N /71.44E (3011m)	Chitral, Baluchistan and Kashmir	Fuel, medicinal, beams &thatching
<i>Juniperus excelsa</i> M. Bieb.	H 4-18m, Medium-sized, leaves ovate 1-2 mm. dens and irregular twigs, The male cones with scales, seeds 3-5.	Bu-35.42N/71.37E (3178m) Bi 35.41N/ 71.40E (2915) Bu-35.42 N/71.38 E (3028 m)	Chitral, Baluchistan and Kashmir	Medicinal, fuel charcoal, beams & thatching
<i>Cedrus deodara</i> (Roxb. Ex Lamb.) G.Don	H-14-50 m tall, brown furrowed bark. Needle-like leaves - 7-30, persistent, 2-6.5 cm, Male cones 3-5.5 x 1-2.5 cm), seeds are winged.	Bu-35.419N/71.37 E (2987m) Ru-35.47 N/ 71.38 E (2838m) Bi-35.479N/ 71.37 E (3030m)	Chitral, Kaghan, Kashmir Kurram Agency, Swat- Kohistan	Construction purpose, Furniture industries, fuel, medicinal, bridge making, poles
<i>Pinus gerardiana</i> Wall. ex Lamb.	H-18 meters, thin bark with silvery-grey hue. Leaves needle like in clusters of 3, 6-12 cm in length, seeds cylindrical short winged.	Bu-35.43N/71.42E (2460 m) Ru-35.47N /71.49E (2,359 m) Bi-35.37N/71.39 E (2578 m)	Chitral, Himalaya and in Baluchistan.	Construction purpose, Furniture industries, fuel, medicinal, bridge making, poles, Carets,
<i>Pinus wallichiana</i> A. B. Jacks	H- 5-50 m in height, greyish-brown, fissured bark ,needle-like leaves in 5, 5-13 cm, Male cones in cluster, 1-2 x 0.5-1 cm), Female cones, in pairs of 2-3, 8-19 x 3-8.5 Seeds are winged.	Ru-35.42N/71.38 E (3022m) Bu-35.41N/71.40E (2093m) Bi-35.38N/71.45E (3011)	Chitral, Himalaya and in Baluchistan.	Furniture making, bridges, resin as medicinal, fuel& charcoal, poles, construction of houses
<i>Pinus roxburghii</i> Sarg.	H- 40-50 m , bark is brownish-red, deeply fissured, Needle-like leaves in fascicles of 3, Male cones, 1-4 x 0.3-0.87 cm, overlapping microsporophylls. Female cones 5.5-9.5 x 4.0-7.5 cm. The seeds are winged.	Bi-35.37N/71.39 E (2578 m) Bu-35.43N/71.42E (2460 m) Ru-35.479N/71.39 E (1764m)	Chitral, Kashmir Swat- Kohistan, Himalaya	Construction purpose, Furniture industries, fuel, medicinal, bridge making, poles, Carets,

<i>Picea smithiana</i> (Wall.) Boiss	H-20-45 m tall, bark is brown, Needle-like leaves arranged spirally, 1.5-4.5cm .Male cones ,solitary, ovoid (1.0-3 x 1.5 cm), , Female cones 6-12 x 3.0-6 cm, winged Seed.	Bu-35.41 N/71.37 E ( 2929m) Ru-35.40 N/71.36 E(2939m)	Chitral, Gilgit, Kaghan, Kashmir, Kurram, Swat- Kohistan	Framing material, boxes, crates and Sitarboards.
<i>Ephedra gerardiana</i> Wall ex. Stapf.	Shrubby & compact, 10 to 120 cm, green ascending and smooth branches. Male strobili in clusters of 2-3, Female strobili are solitary , fruit are berries	Bi-35.37N/71.39 E (2578 m) Bu-35.41N/71.40E (2267m) Bu 35.42 N/71.39E 3008m)	Chitral, Kashmir Swat- Kohistan	Medicinal, Fuel
<i>Ephedra intermedia</i> Schrenk & Meyer	Compact shrubby up to 55 cm long, spreading, striated branches, Male strobili in whorls up to 8 in number, Female strobili a in whorls. The berries are ovoid and red.	Bi-35.37N/71.39 E (2578 m) Bu-35.41N/71.40E (2267m) Bu 35.42 N/71.39E 3008m)	Chitral, Kashmir Swat- Kohistan	Medicinal, Fuel

Table 2. Gymnosperms Predominant upper storey (except *Ephedra* species) community, percentage distribution, Average DBH and average AGB

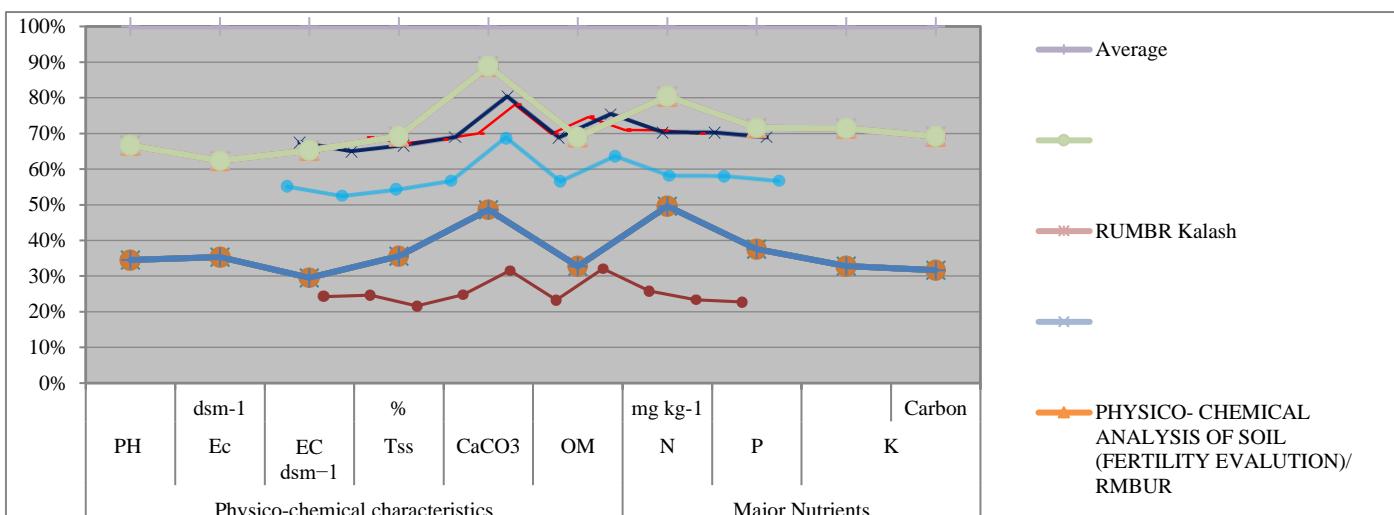

Fig.4. Showing comparison of soil inn Bumburet, Birir and Rambur

## CONCLUSION

It has concluded during the present study that among all the three Valleys of Kalash, Bumburet has the most fertile soil and has therefore, presenting the maximum floristic diversity followed by Birir and Rambur Valleys. Eleven communities were found and it was concluded that *Cedrus deodara-Pinus gerardiana* community has more species diversity as compare to *Pinus wallichiana-Juniperus excelsa* communities.
